ONE HEALTH APPROACH TO ANTI MICROBIAL RESISTANCE

Antimicrobial resistance (AMR) is a growing global health challenge in which microorganisms develop the ability to survive medicines designed to eliminate them. It is not limited to humans; the misuse and overuse of antimicrobials in human healthcare, veterinary practice, agriculture, food production, and the environment can contribute to the spread of resistant microorganisms. The **One Health approach** recognizes that human, animal, and environmental health are closely interconnected and therefore requires coordinated action across all these sectors. Pharmacists play an important role in this approach by promoting the rational and responsible use of antimicrobials, supporting appropriate antibiotic selection and duration, educating patients about completing prescribed courses, discouraging self-medication, and contributing to antimicrobial stewardship programs. Collaboration among pharmacists, physicians, veterinarians, microbiologists, farmers, public-health professionals, and communities can help reduce unnecessary antimicrobial exposure and slow the development and transmission of resistance. Strengthening surveillance, infection prevention, public awareness, responsible prescribing, and environmental protection is essential for preserving the effectiveness of existing antimicrobials. A coordinated One Health strategy can help protect people, animals, ecosystems, and future generations from the growing threat of antimicrobial resistance.
